

1) What error message did you encounter (if any)?

The program displayed the error message "Invalid input. Enter a valid day from 1-30: " when I entered 31. However the program continued anyways

2) What unexpected behavior did your program exhibit?

The program didn't stop running when I inputted the invalid number, it instead displayed the error message but continued with the next line of code:

```
What year were you born (enter a number): 2009
What month were you born (type a month): november
What day were you born (enter a number): 31
Invalid input. Enter a valid day from 1-30:
What year is it today (enter a number): |
```

3) What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

The issue was caused by an error in the validation of the while loop. The program checked if the day was greater than 31 in one line, however it checked if the day was greater than 30 in another line, which led to the error message being displayed but the program kept running.

```
//creates a error handling loop
while (pday < 1 || pday > 31) //checks if input is between 1-30
{
```

4) How did you fix the issue?

I changed the validation so that the program only checks for days greater than 30

5) Provide the corrected code or solution using a screenshot.

```
//creates a error handling loop
while (pday < 1 || pday > 30) //checks if input is between 1-30
{
```
