

1) What error message did you encounter (if any)?

I did not encounter any error message, but the program displayed an inaccurate number of decimal places for the total cost

2) What unexpected behavior did your program exhibit?

The program displayed the total cost with more than two decimal places instead of rounding to the nearest hundredth

A screenshot of a terminal window with a dark background. The text is as follows:

```
This programs calculates the cost of printing any amount of paper copies  
  
How many copies would you like to print?:  
173  
|  
The price per copy is $0.28  
The total cost is $48.44000000000001
```

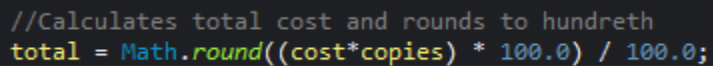

3) What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

The issue was caused by a calculation error. I initially performed the calculation without rounding the result.

4) How did you fix the issue?

I added `Math.round()`; to round the number and display the result to the correct number of decimal places.

5) Provide the corrected code or solution using a screenshot.

A screenshot of a code editor showing two lines of JavaScript code:

```
//Calculates total cost and rounds to hundreth  
total = Math.round((cost*copies) * 100.0) / 100.0;
```
