1) **What error message did you encounter (if any)?**
   I did not encounter any error message, but the program would change the boolean to false and never change it back

2) **What unexpected behavior did your program exhibit?**
   This caused the program to stop evaluating prime numbers, because the boolean remained false

3) **What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)**
   The issue was caused by a handling error. I forgot to reset the boolean to true

```
for (primes = num1; primes <= num2; primes++)
{

    //checks if the numbers are less than 2
    if (primes < 2)
    {
        prime = false;
    }

    //checks to see if the numbers are divisible by any number other than 1 and themselves
    for (j = 2; j < primes; j++)
    {
        if (primes % j == 0)
        {
            prime = false;
            break;
        }
    }
    if (prime)
    {
        //prints the number if it's prime
        System.out.print(green+primes+", "+reset);
    }
}
```

4) **How did you fix the issue?**
   I reset the boolean to true at the start of each loop

5) **Provide the corrected code or solution using a screenshot.**

```
for (primes = num1; primes <= num2; primes++)
{
    prime = true;

    //checks if the numbers are less than 2
```
