1) **What error message did you encounter (if any)?**
I did not encounter any error message, but the program wouldn't display the correct number of decimal places when displaying the total value.

2) **What unexpected behavior did your program exhibit?**
The program would round to the nearest integer

```
This program calculates total coin value based on pennies, nickels, dimes, and quarters.

How many Pennies do you have:
0
How many Nickels do you have:
0
How many Dimes do you have:
0
How many Quarters do you have:
6
Total Coin Value = $1
```

3) **What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)**
The issue was caused by a handling error. I had not rounded the program calculations to the nearest hundredth as I should have.

```
{
    //Calculates the total value in cents
    int total = (pennies + (nickels * 5) + (dimes * 10) + (quarters * 25) / 100);

    //Displays dollar sign, and rounds total to a dollar value with 2 decimal places.
    return ("$"+total);
}
```

4) **How did you fix the issue?**
I changed how the calculation was performed, and I used String.format to round the total to the nearest hundredth.

5) **Provide the corrected code or solution using a screenshot.**

```
{
    //Calculates the total value in cents
    int total = (pennies + (nickels * 5) + (dimes * 10) + (quarters * 25));

    //Displays dollar sign, and rounds total to a dollar value with 2 decimal places.
    return String.format("$%.2f", total / 100.00);
}
```
